What is a Pen Gesture?

- Simple ink stroke or strokes to convey an idea
 - fast to perform
 - easy to remember
- Typically disappear after they are recognized
- Supports in-band interaction

Fall 2010

CAP 6105 - Pen-Based User Interfaces

Gesture Types

- Single stroke
- Multi-stroke
 - compound gestures
 - punctuated gestures
- Trade-off in recognition between single and multiple stroke gestures
- Used in
 - modeling
 - command languages
 - invoking interface widgets

Single stroke gesture

Multi-stroke gesture

Gestures in Modeling

- Used in 2D/3D object modeling
- Distinction between sketch-based modeling and gestures in modeling
- Used to
 - create geometry
 - manipulate geometry
 - guidance for computational algorithms

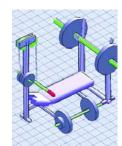

www-ui.is.s.u-tokyo.ac.jp/~takeo/research/teddy/teddy.htm

Fall 2010

CAP 6105 - Pen-Based User Interfaces

SKETCH

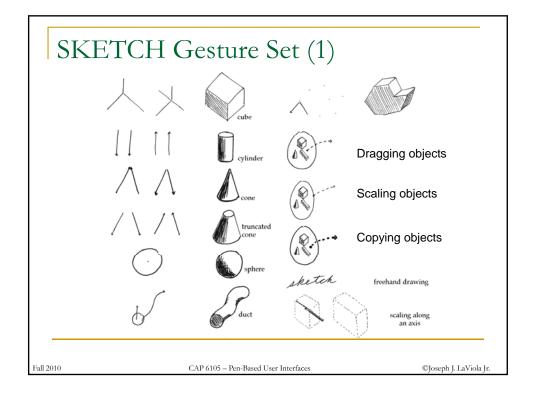

- Seminal work by Zeleznik et al. (1996)
- Conceptual modeling
- Uses simple lines and curves to build geometric primitives
 - □ cubes, cylinders. pyramids, etc...
- No machine learning-based recognition used
 - simple FSA
- Does make use of modifier keys

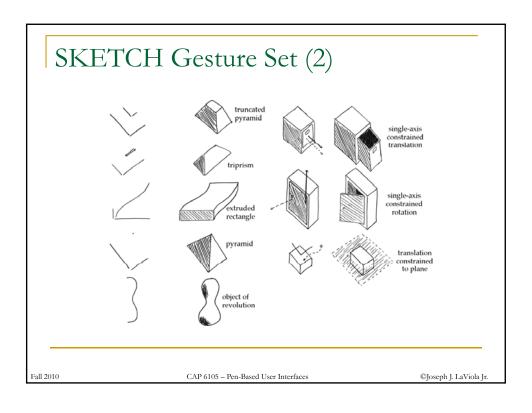

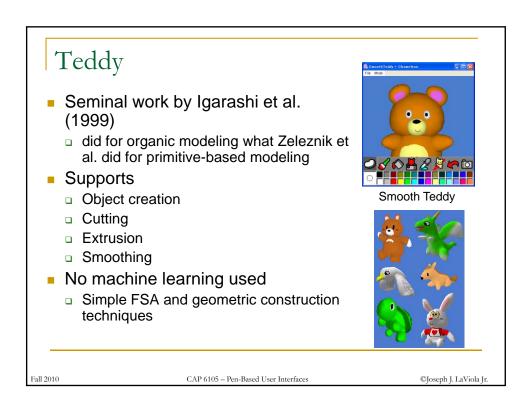

Fall 2010

CAP 6105 - Pen-Based User Interfaces

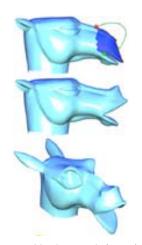

Surface/Mesh Editing

- Fine line between sketching and gestures
- Uses simple gesture as input to a surface editing algorithm
- This type of approach has been used for image processing as well
 - see work of Salesin

Nealen et al. (2005)

Fall 201

Gestures as Command Languages

- Gestural commands
 - replace traditional WIMP user interfaces
 - also used to invoke interface widgets
- Notion of in-band gestures
 - invoking commands and operations at the location of interaction
 - contrasts with having to move to top/side of the screen to press a button or find a menu item
- Used in
 - entering text
 - text editing
 - note taking
 - mathematical apps
 - etc...

Fall 2010

CAP 6105 - Pen-Based User Interfaces

Graffiti

- Language for entering text
- Maps to keyboard
- Used with Palm Pilot
- Single stroke language
 - Has prefix for some symbols
- Takes a while to learn

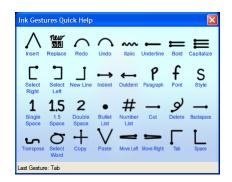

Fall 201

CAP 6105 - Pen-Based User Interfaces

Text Editing

- Example of a gesture set taken from real world and developed for pen computers
- Natural connection between pencil and paper and computer

Fall 2010

CAP 6105 – Pen-Based User Interfaces

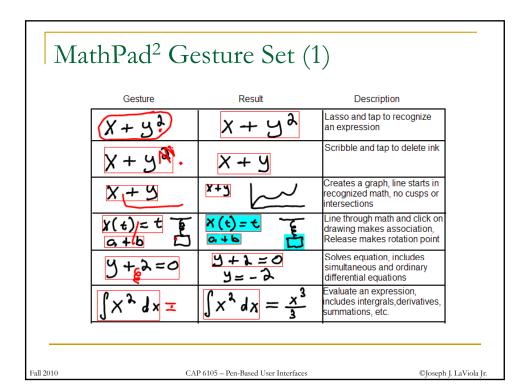

MathPad²

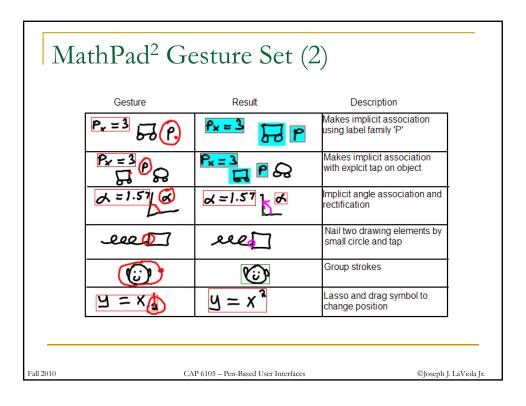

- Simple gesture set for
 - invoking operations
 - manipulating ink
- Uses notion of punctuated gestures
 - multi-stroke (gesture + punctuation)
 - makes use of context
- Why?
 - reduce number of gestures
 - overload appropriate gestures
 - reduce conflicts

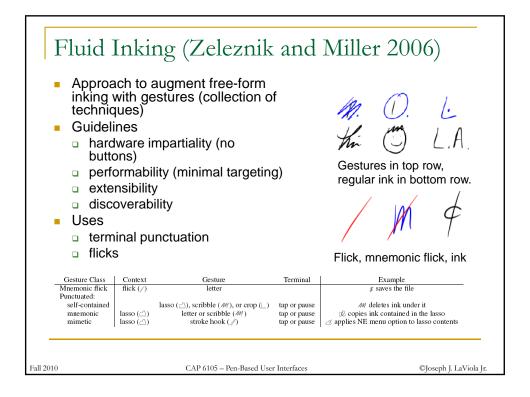

Fall 2010

CAP 6105 - Pen-Based User Interfaces

Recognizing Gestures

- FSA's and simple primitive operators
 - conditionals and saving state from one event trigger to another
 - Operators can be features
 - same features used in machine learning!
 - features must be excellent discriminators
- Machine learning techniques
 - SVMs, K-nearest neighbor, AdaBoost
 - more on this soon!

Anatomy of a Gesture

Fall 2010

```
Input: Strokes s_{i-1} and s_{i-2}, a bounding box threshold \epsilon_{box}, and a line
                                                    difference threshold \epsilon_{diff}.
 Detecting and equal
                                                    Output: True or false.
 sign
                                                    \texttt{DETECTEQUALSIGN}(s_{i-1}, s_{i-2}, \epsilon_{box}, \epsilon_{diff})
                                                              P \leftarrow Points(s_{i-1})
                                                              Q \leftarrow Points(s_{i-2})
                                                             b_1 \leftarrow BoundingBox(s_{i-1})
                                                             b_1 \leftarrow BoundingBox(s_{i-1})
b_2 \leftarrow BoundingBox(s_{i-2})
slen_1 \leftarrow \sum_{i=2}^n \|P_i - P_{i-1}\|
slen_2 \leftarrow \sum_{i=2}^n \|Q_i - Q_{i-1}\|
if \quad slen_1 > \epsilon_{box} \sqrt{Width(b_1)^2 + Height(b_1)^2} \quad \text{or } slen_2
\epsilon_{box} \sqrt{Width(b_2)^2 + Height(b_2)^2}
                                                                   return false
                                                               \mathbf{if} \ Width(b_1) < Height(b_1) \ \mathbf{or} \ Width(b_2) < Height(b_2)
                                                    (10)
                                                                  return false
Note that as the gesture
                                                    (11)
                                                               diff_1 = |X(P_1) - X(Q_1)|
set increases the more
                                                    (12)
                                                               diff_2 = |X(P_n) - X(Q_n)|
                                                               \text{if} \quad LineOverlap(P_1,P_n,Q_1,Q_n) \text{ and } \textit{diff}_1 < \epsilon_{\textit{diff}} \text{ and } \textit{diff}_2 < \epsilon_{\textit{diff}}
tests you typically have
                                                    (13)
                                                    (14)
                                                                 return true
to employ to avoid
                                                               _{
m else}
                                                    (15)
conflicts.
                                                    (16)
                                                                    {f return} false
```

9

Learning Gestures

- How many gestures is too many?
- Learning strategies
 - Simple tutorials/manuals
 - Gesture practice tools
 - color coding (useful for multi-stroke gestures)
 - Showing gestures through animations
- Techniques not proven open research area
